# Overview

**When is Simple Workflow the answer?**

**Workflows, deciders, and workers**

**Envision the complete flow**

**Cooking a workflow from scratch**

**How a workflow should behave**

# Understanding Simple Workflow

---

**EC2**

Virtual server  
hosting

**Elastic Beanstalk**

Simple application  
deployment

# Simple Workflow

Service that acts as an intermediary coordinator to disparate services and applications. Exposes an interface to connect to.

Simple Workflow confusing?  
Let's break it down!

Workflow

# WorkflowExecutionStarted

Event that starts the workflow

# DecisionTaskScheduled

Event that indicates a decider  
needs to make a decision

Task List

# DecisionTaskCompleted

Event that indicates a decider  
has responded with a decision

## Decision Response

Decision Type

Decision Attributes

# Activity Task Contents

**Task List**

Where to put the task

**Activity Type**

What type of task to run

**Input**

Input text for the task worker

Workflow

## Workflow

# Pros of Simple Workflow

Decouples workflow steps

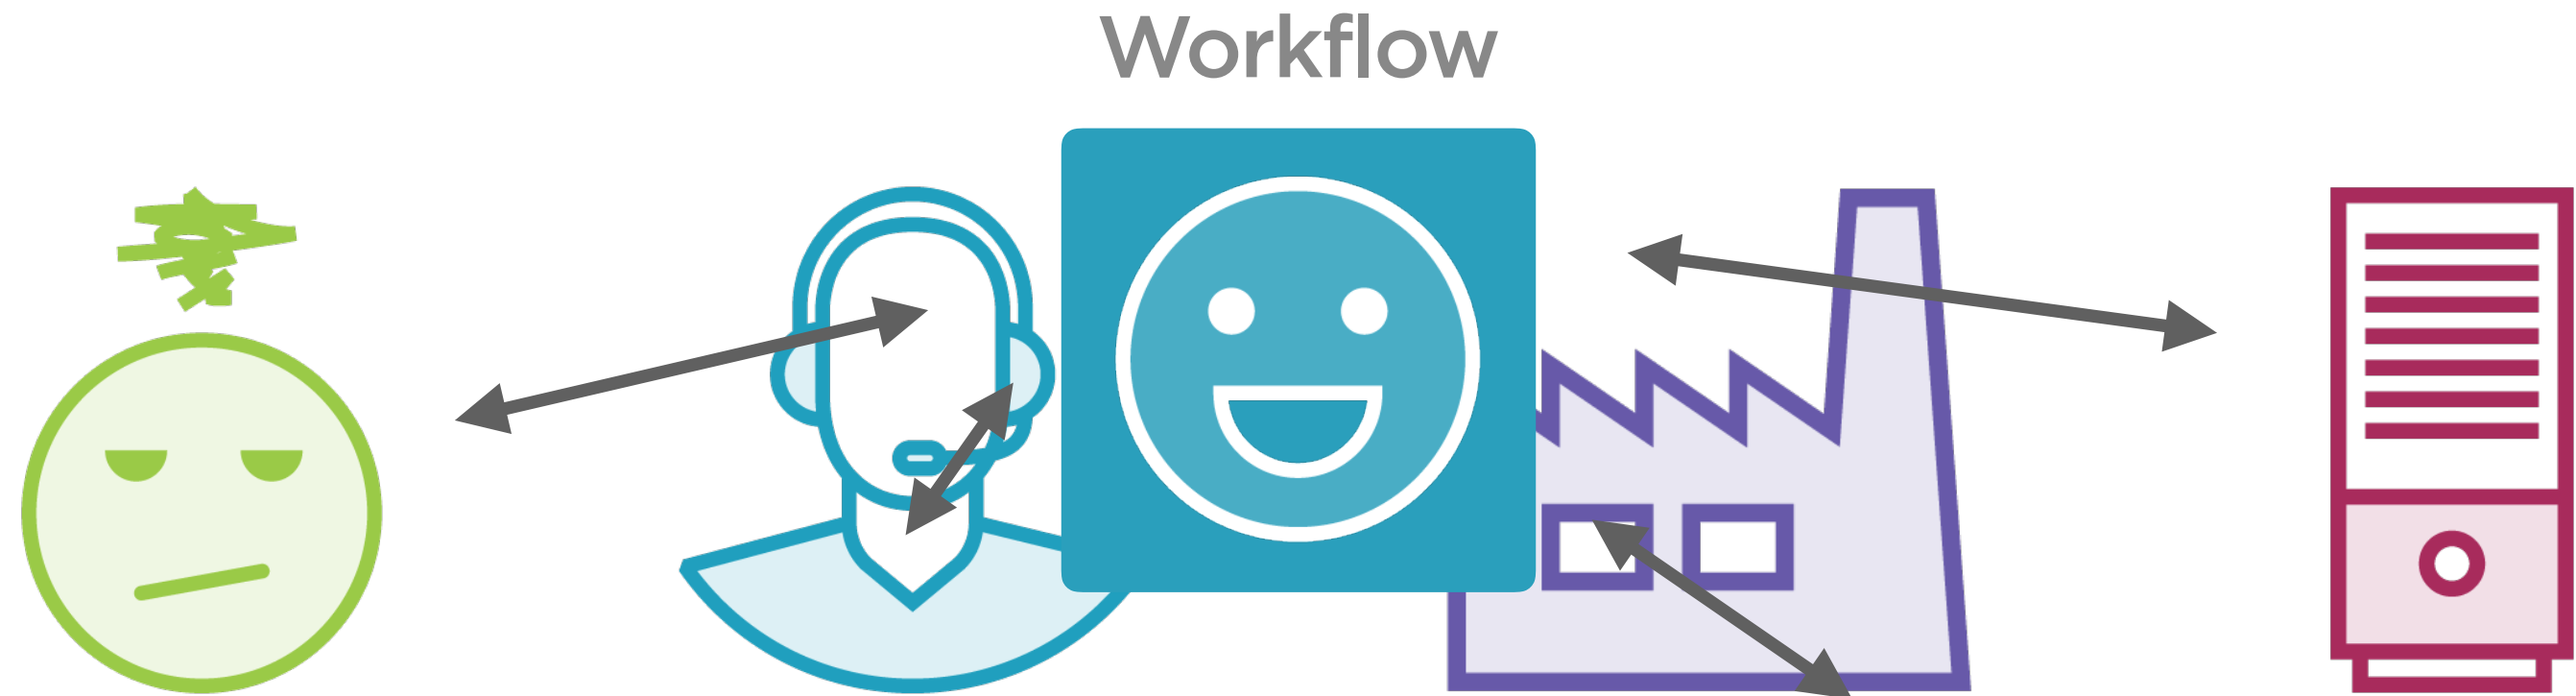

Handles failure and scaling

Works with almost anything

You can even use SWF when  
you have IRL task workers

SWF Use Case Example

# Online Store Return Process

# Workflows, Deciders, and Workers

CompleteWorkflowExecution

### Decision Attributes

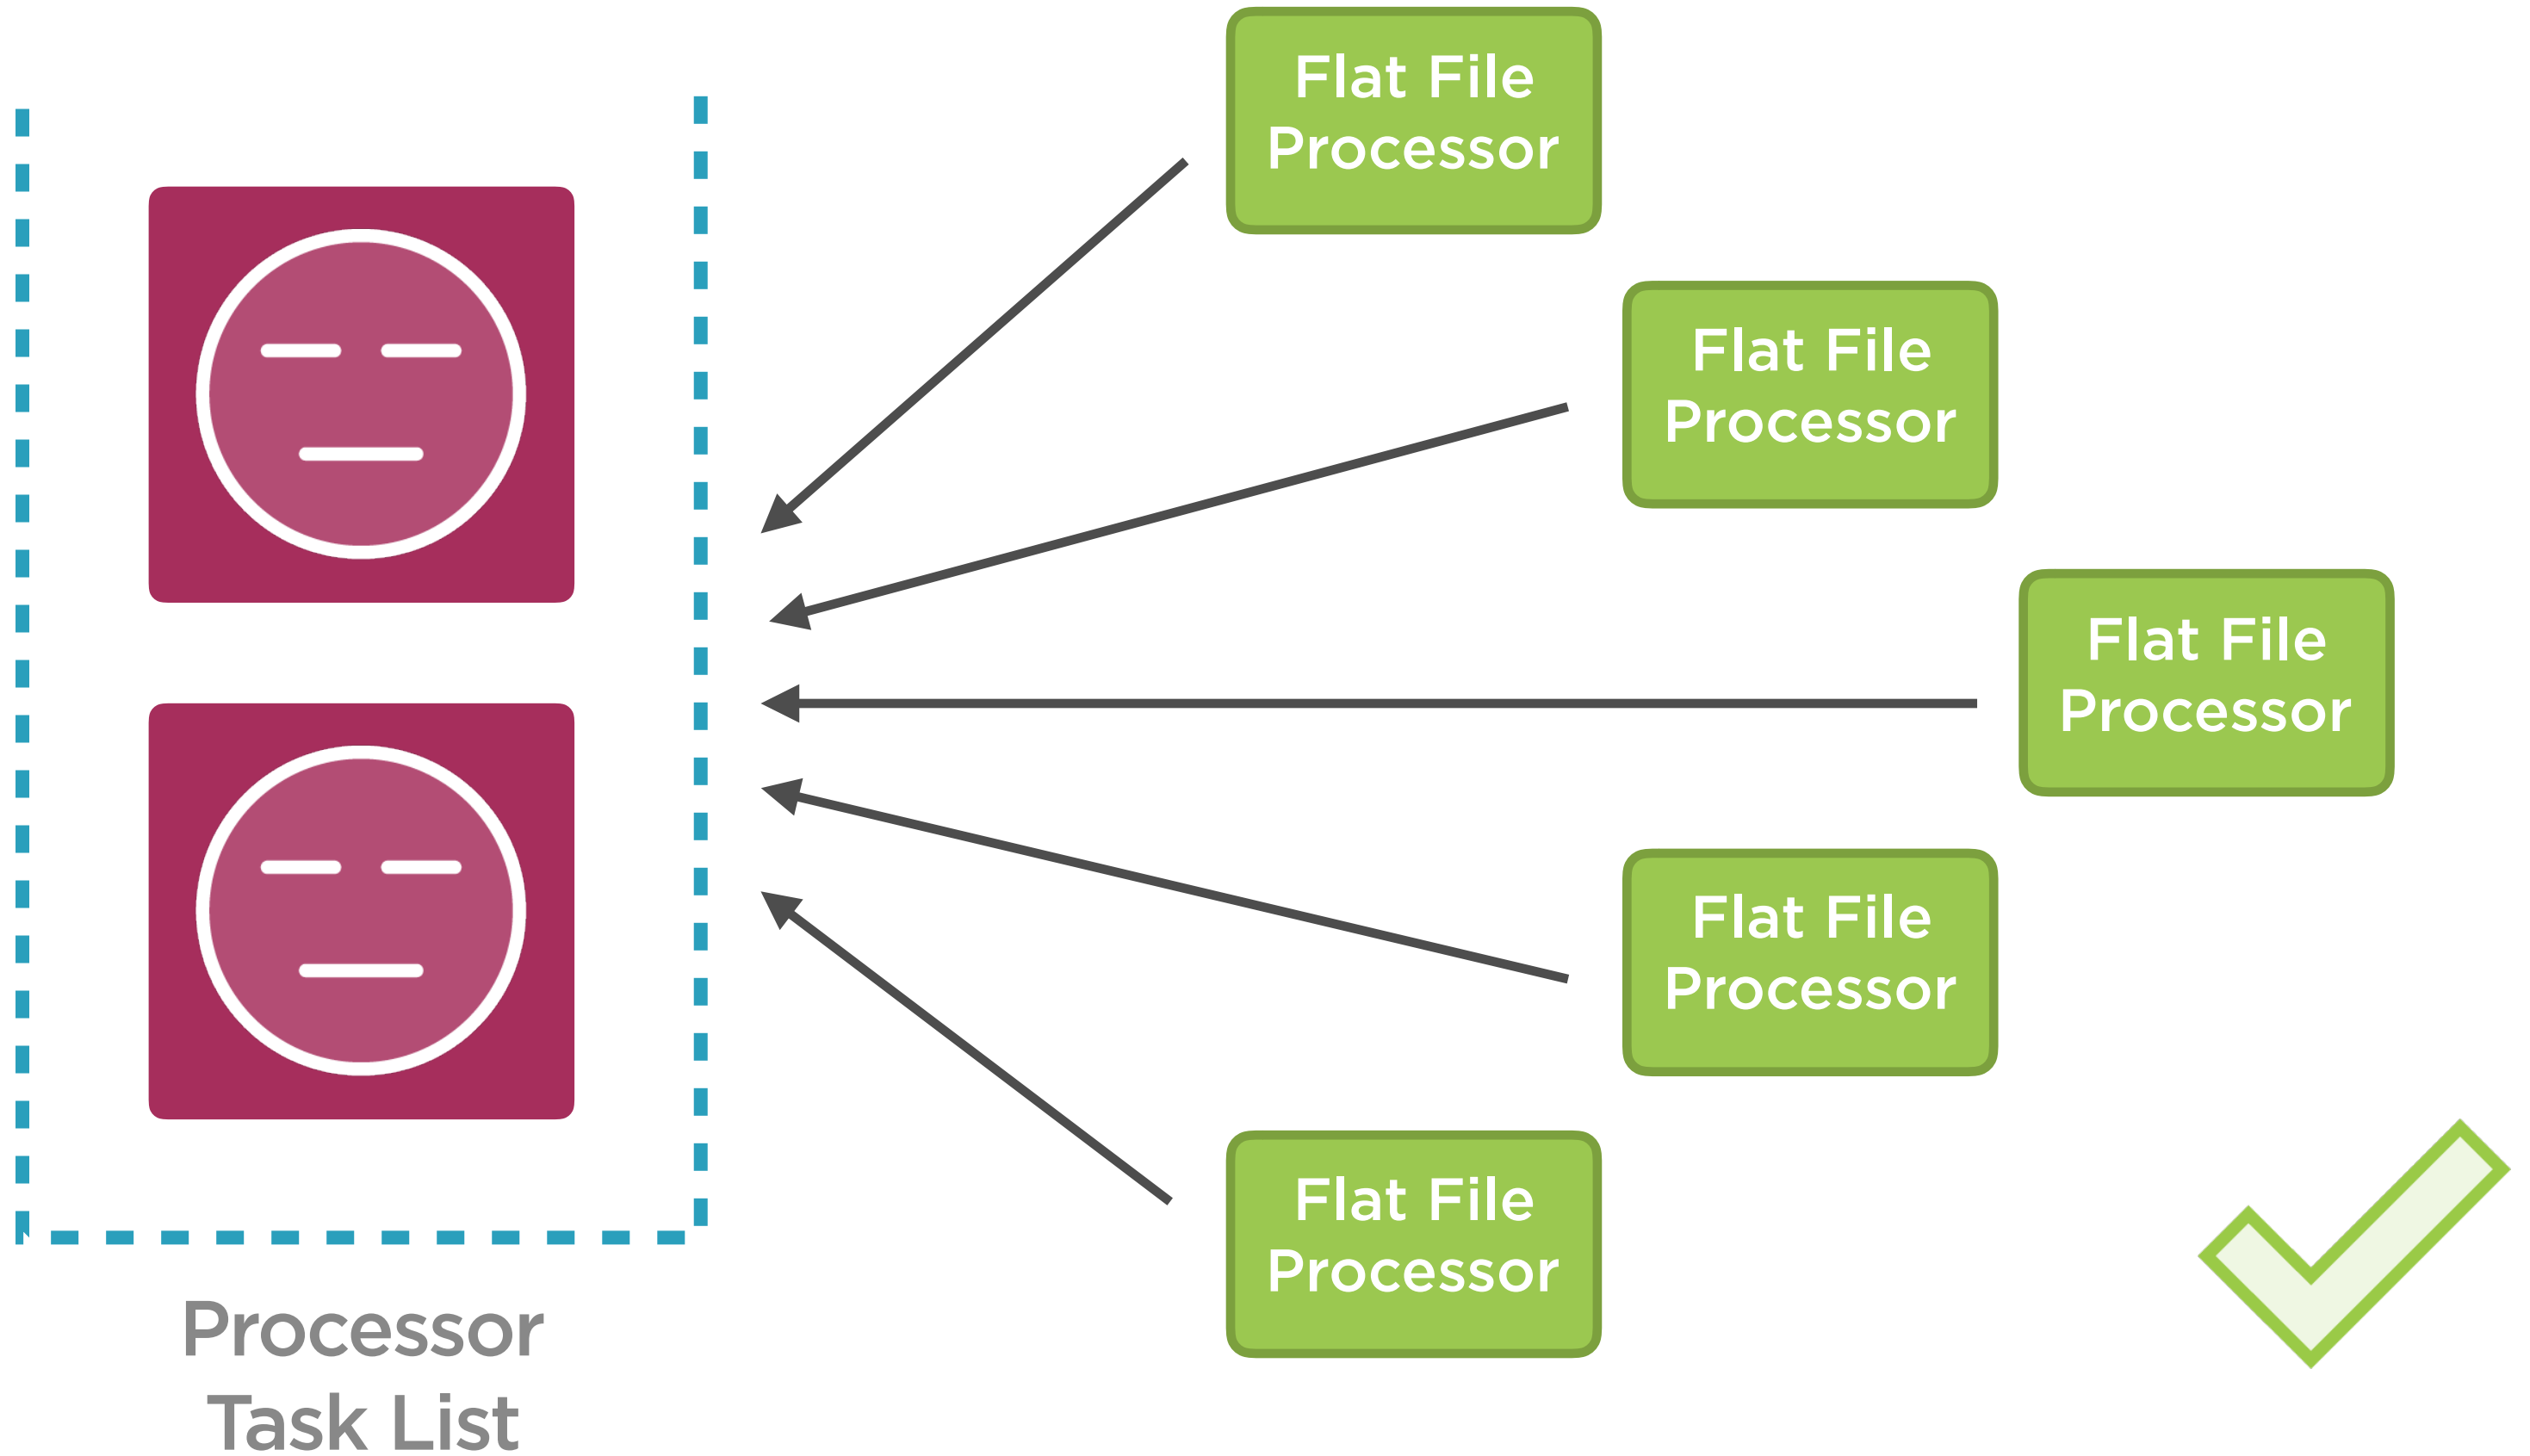

result

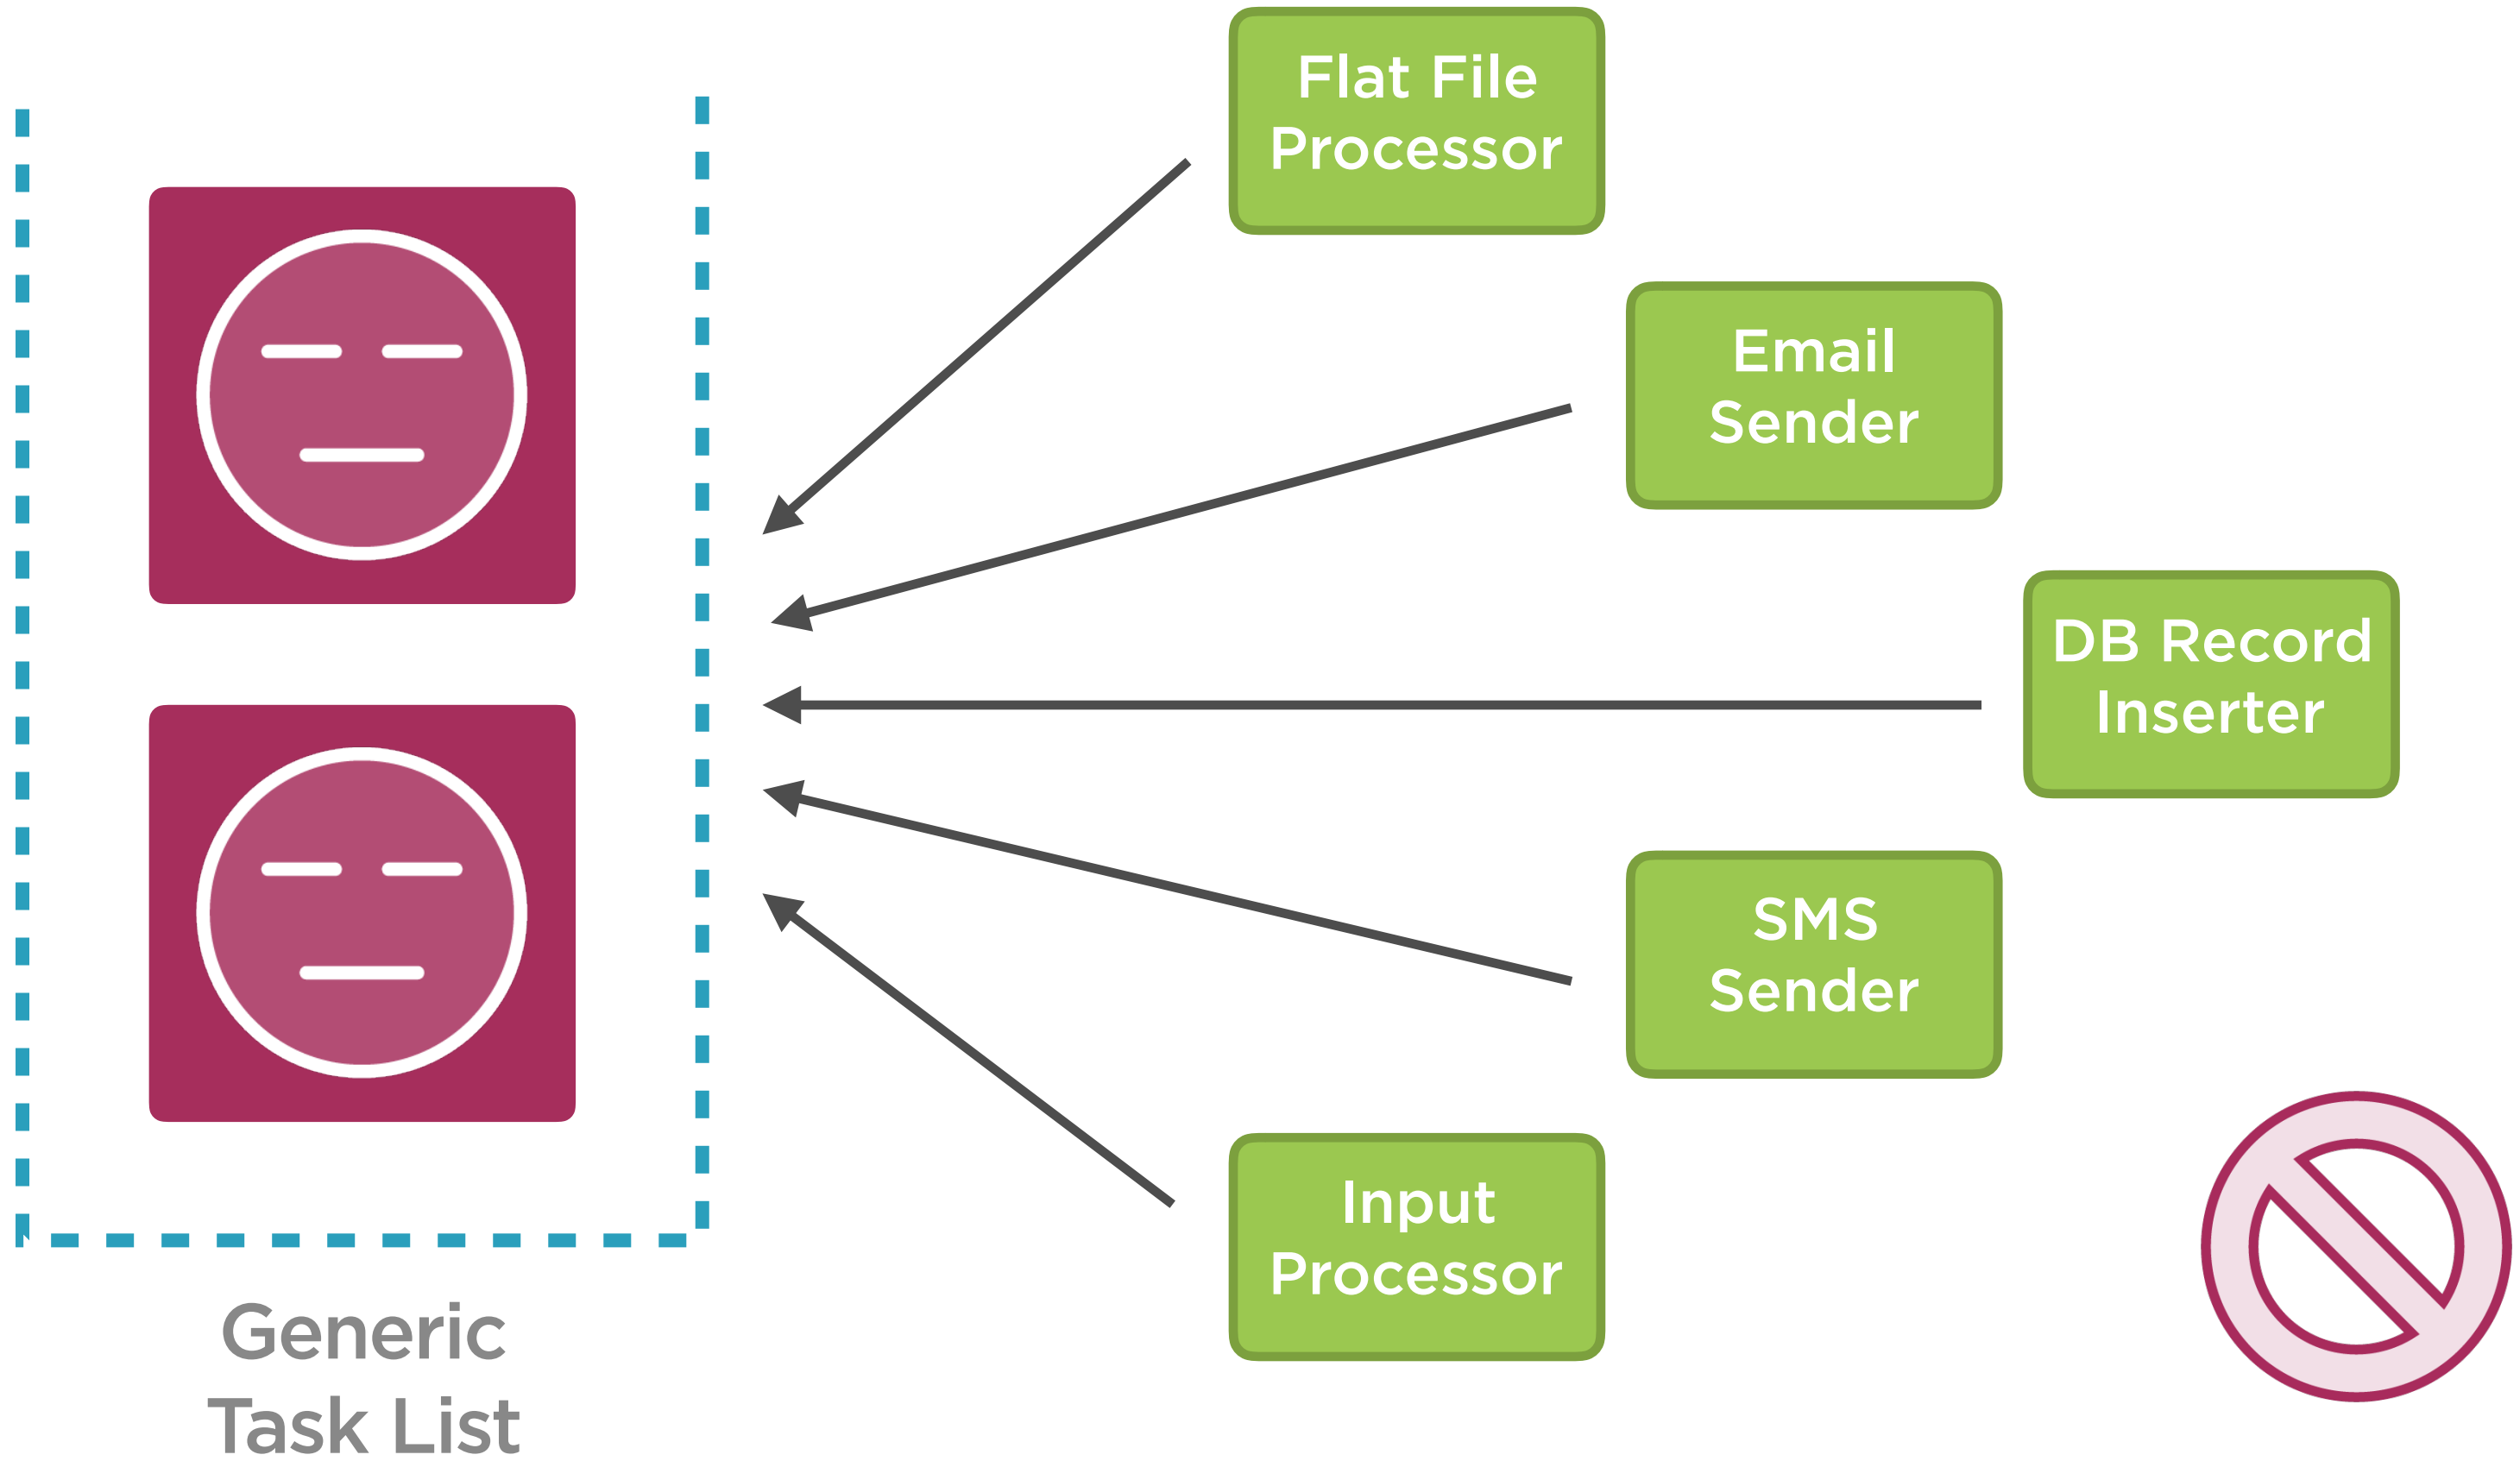

# Worker

Processes activity tasks after polling a task list in a workflow.

Use one task list per activity type.  
This keeps workers from retrieving  
tasks that they can't process.

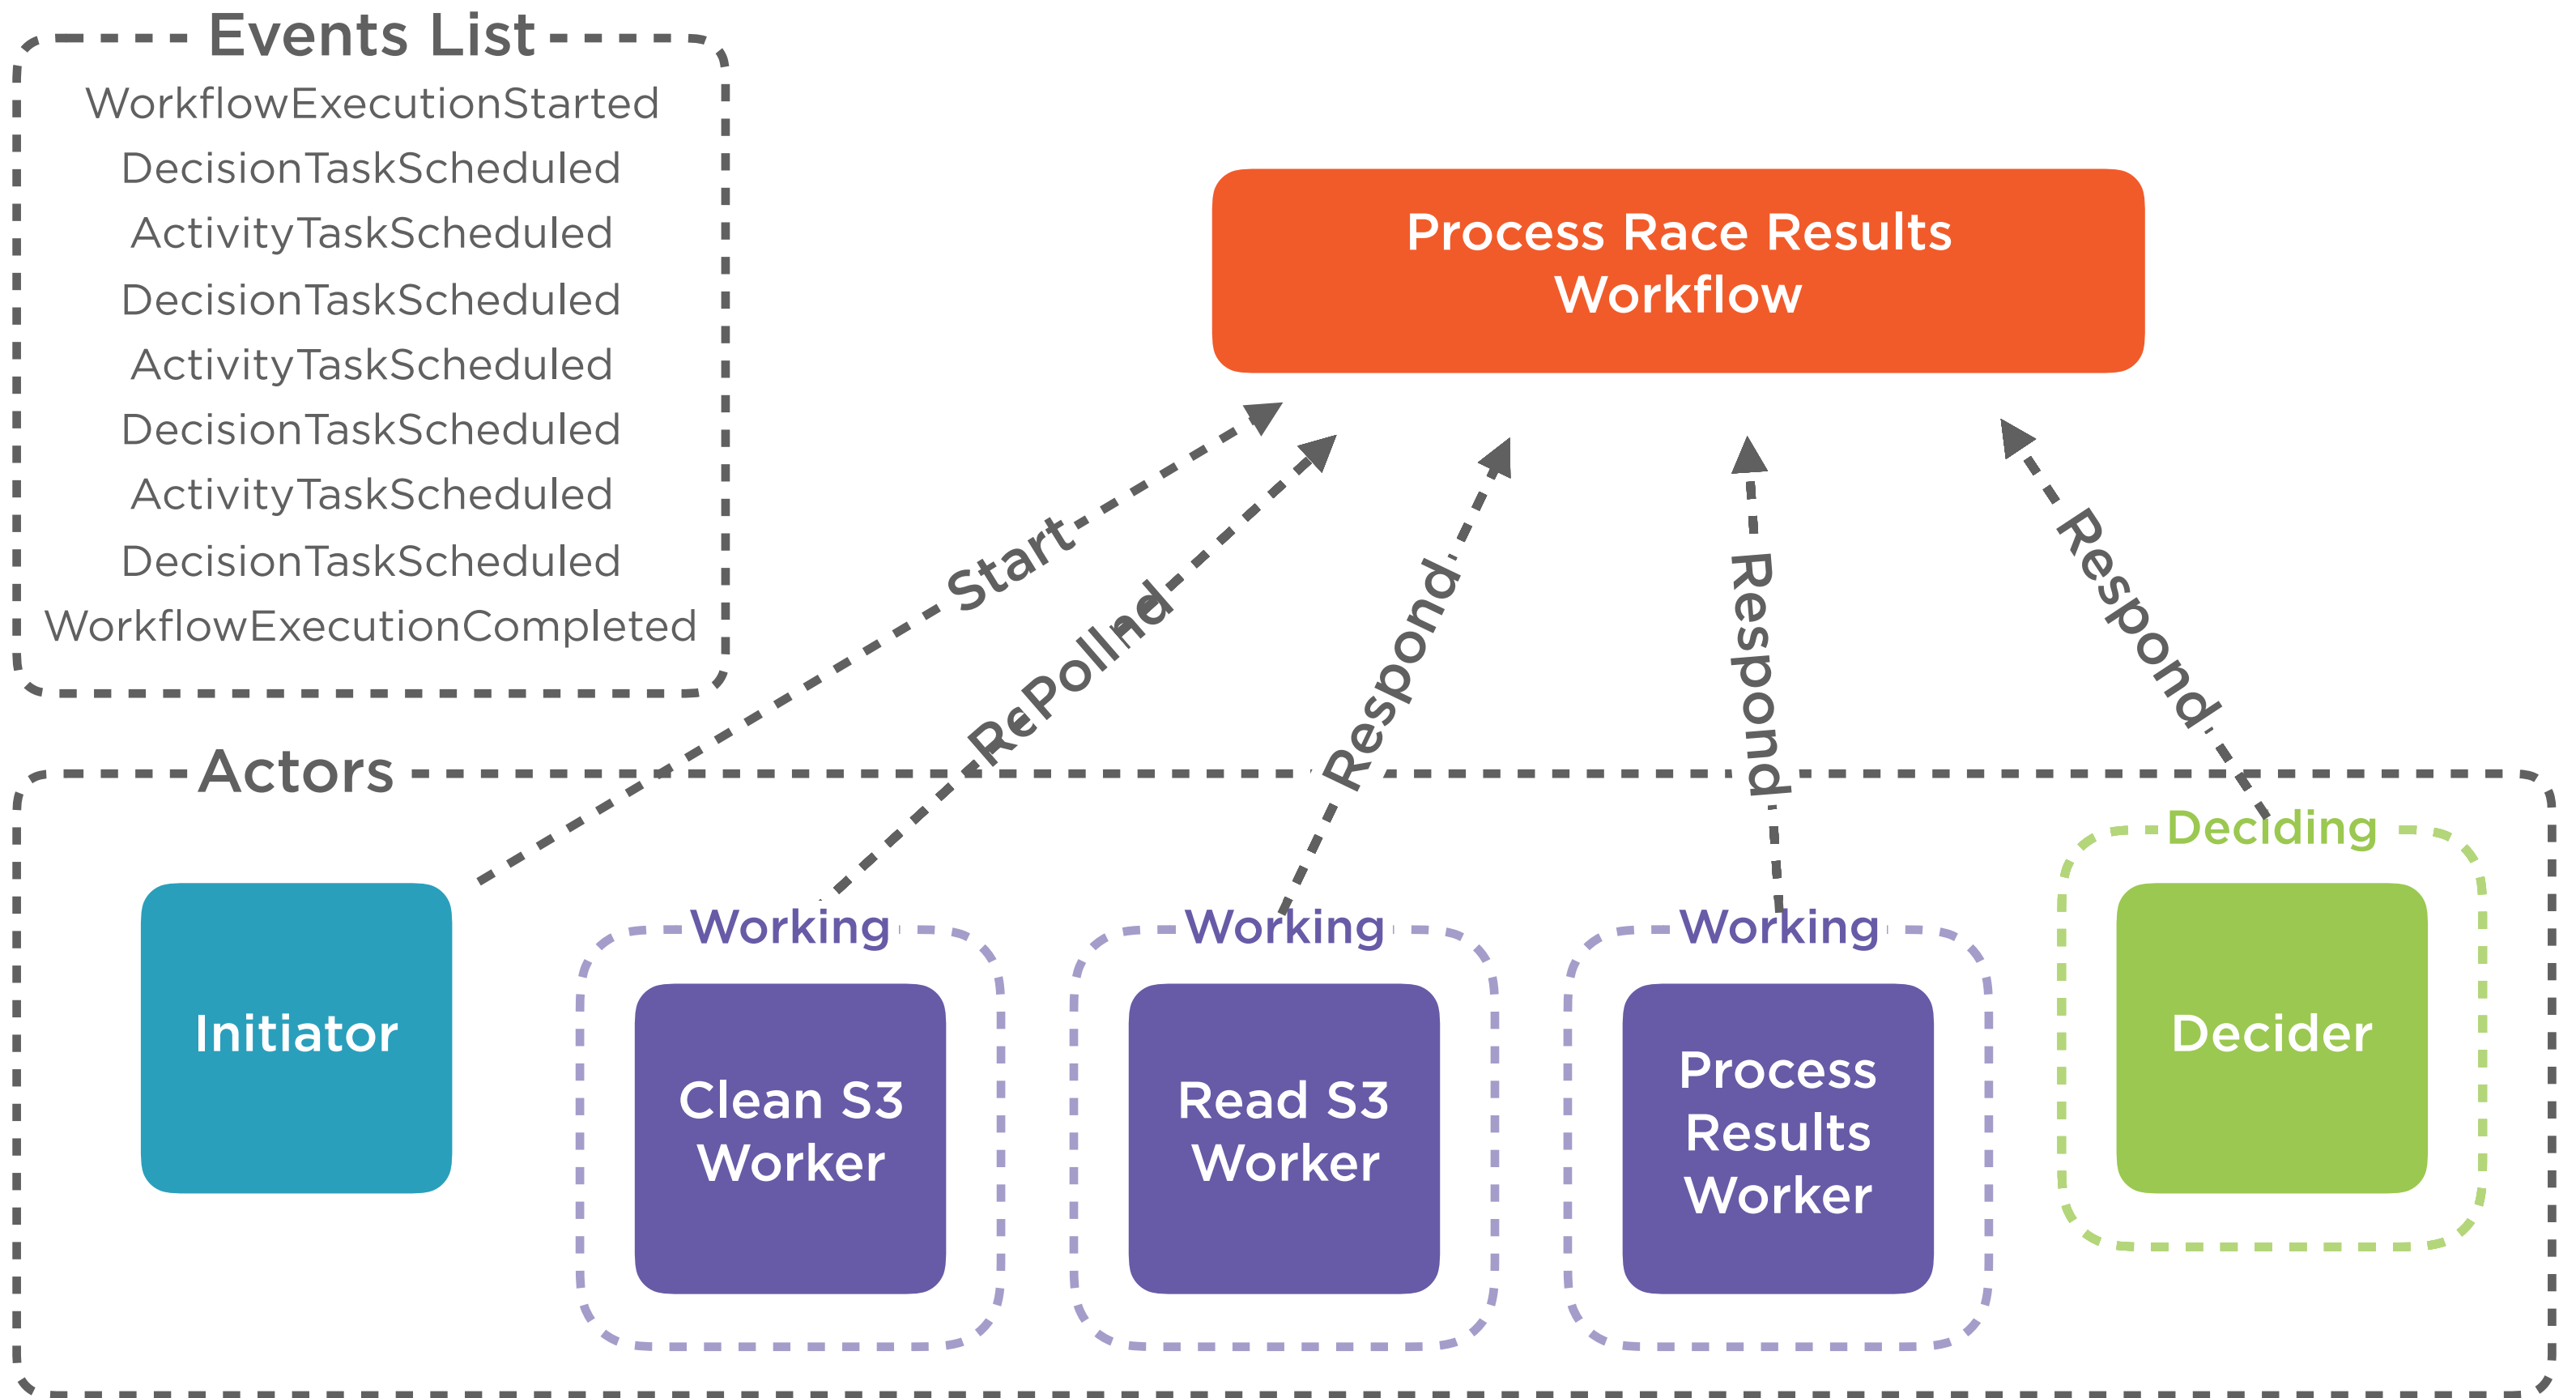

One more thing...

**Tasks are first come,  
first served.**

# A Day in the Life of a Workflow

---

# Creating Workflows in SWF

---

Nothing in SWF can be deleted, only deprecated.

This means that names are one-time use per region.

# Running a Workflow

---

# Conclusion

---

# Summary

**“S” is for “Simple”**

**The nuts and bolts of SWF**

**Animated boxes pretending to be software**

**SWF + Serverless = Magic**

**Executed workflow returns positive result**
